JX RUNTIME + ONYX ENGINE

Onyx runs the model. JX guards the door.

STEP 1 OF 4

01

Install.

```
jx-runtime backend install --engine onyx
```

A prebuilt onyx-engine, checked against its release checksums, lands in the data directory.

STEP 2 OF 4

02

Select.

```
execution.backend: "onyxengine"
```

One setting. Its adapter subclasses the llama.cpp one: same spawn, streaming and restart code.

STEP 3 OF 4

03

Serve.

```
one onyx-engine per loaded model
```

Bound to 127.0.0.1, polled at /health, its OpenAI endpoints proxied through.

STEP 4 OF 4

04

Share.

```
Authorization: Bearer jxr_…
```

Apps and paired devices reach it through JX Runtime's keys, TLS and rate limits.

WHO DOES WHAT

Execution and access, kept apart.

JX Runtime

- Access keys & pairing
- TLS & network posture
- Model installs & fit checks
- Crash detection & restart
- Metrics without content
- Audit log

Onyx Engine

- Inference on llama.cpp
- Continuous batching
- Streaming over SSE
- Tool calls & grammars
- Embeddings
- Multimodal input
